

Research at Fiskaaling in the future

Fish farming on land

Land-based aquaculture has evolved immensely lately, and the Faroe Islands are at the forefront in respect to breeding large smolt. Farming large quantities of good, large smolt on land in large cages puts high demands on the water quality and the environment in which the fish grows up.

Fiskaaling intends to develop knowledge on water quality in Faroese RAS systems, as well as to develop a model to study the current conditions in the farming cages.

Good development of salmon is linked to water quality. Fiskaaling will study, among other things, the connection between water quality, smoltification and fish well-being.
